THE MOST WIDELY USED SOFTWARE IN 2020

Our company, The Mudoc Corporation, expects a software invention we are developing to become the world's most widely used software product within three to five years. That invention is *interactive movable type*. In the 15ᵗʰ century, Gutenberg's movable metal type brought about a revolution in print-on-paper publishing and led to extensive increases in literacy around the world and to the operation of public schools in many nations. In this century, interactive movable type will bring about a revolution in electronic publishing and will lead to universal literacy and to a manyfold increase in the consumption of text in every nation – especially in the less-developed countries.

Interactive movable type (which, for short, is often called "mūvable type") is the centerpiece of a new information technology, *the mudoc technology*. Interactive movable type and the other tools of the mudoc technology are described in considerable detail at The Mudoc Corporation's website, www.mudoc.com

If, after considering the extensive benefits that may accrue through the wide availability of the tools of the mudoc technology, you think you might be interested in participating in their development, implementation, and/or utilization, take a look at our Web page "Call for Collaborators, Contributors, and Co-conspirators" and let us know what you might like to do with us. The URL for that page is http://www.mudoc.com/collab.pdf

Added note: If you would like to help right now, a simple thing you might do is to bring this page – and pages like "On Saving a Dying Planet" and "The Mudoc Mission" at mudoc.com to the attention of your friends and people you know in information technology, in academia, or in the media.
